Lab 9 Solutions

Veerasak Kritsanapraphan

We'll begin by loading some packages.

```
library(MASS)
library(plyr)
library(ggplot2)
library(reshape)
##
## Attaching package: 'reshape'
## The following objects are masked from 'package:plyr':
##
##
       rename, round any
Let's form our favourite birthwt data set.
# Rename the columns to have more descriptive names
colnames(birthwt) <- c("birthwt.below.2500", "mother.age", "mother.weight",</pre>
    "race", "mother.smokes", "previous.prem.labor", "hypertension", "uterine.irr",
    "physician.visits", "birthwt.grams")
# Transform variables to factors with descriptive levels
birthwt <- transform(birthwt,</pre>
            race = as.factor(mapvalues(race, c(1, 2, 3),
                               c("white","black", "other"))),
            mother.smokes = as.factor(mapvalues(mother.smokes,
                               c(0,1), c("no", "yes"))),
            hypertension = as.factor(mapvalues(hypertension,
                               c(0,1), c("no", "yes"))),
            uterine.irr = as.factor(mapvalues(uterine.irr,
                               c(0,1), c("no", "yes")))
```

ANOVA with birthwt data

[36] 3 or more 3 or more 0

(a) Create a new factor that categorizes the number of physician visits into three levels: 0, 1, 2, 3 or more.

```
pvb <- unique(birthwt$physician.visits)</pre>
repvb <- as.character(pvb)</pre>
for (i in 4:length(repvb)) {
  repvb[i] = "3 or more"
birthwt <- transform(birthwt, phys.visit.binned1 = as.factor(mapvalues(physician.visits, pvb, repvb)))
birthwt$phys.visit.binned1

## [183] 0
                                          2
                                                                            3.or.more
```

```
## Levels: 0 1 2 3.or.more
```

Hint: One way of doing this is with map values, by mapping all instances of 3, 4,... etc, to "3 or more".

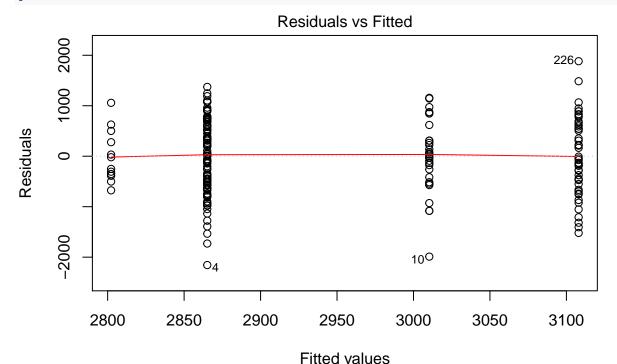

(b) Run an ANOVA to determine whether the average birth weight varies across number of physician visits.

```
aov.birthwt <- aov(birthwt.grams ~ phys.visit.binned, data = birthwt)
summary(aov.birthwt)</pre>
```

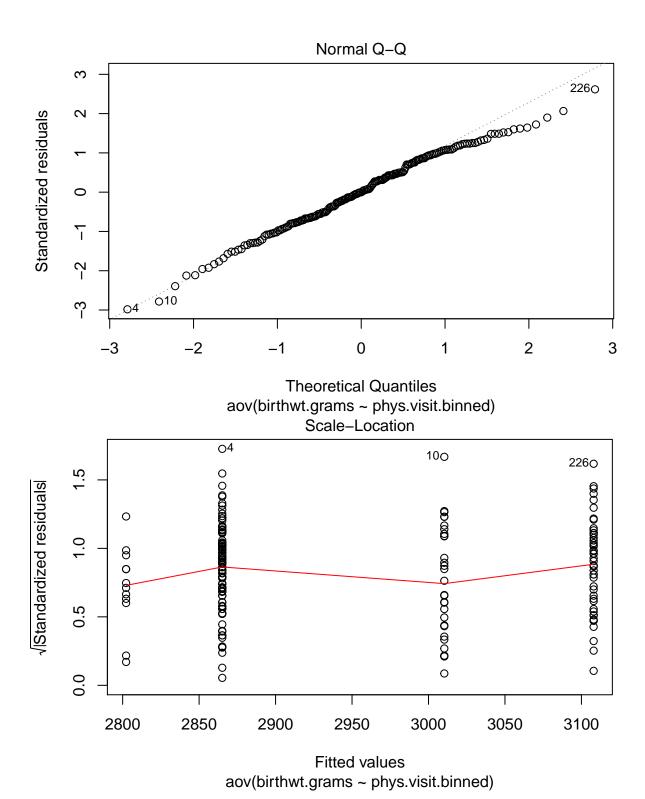

```
## Df Sum Sq Mean Sq F value Pr(>F)
## phys.visit.binned 3 2259057 753019 1.426 0.237
## Residuals 185 97710599 528165
```

The p-value is greater than 0.05, so the variation in birthweight across number of physician visits is not statistically significant.

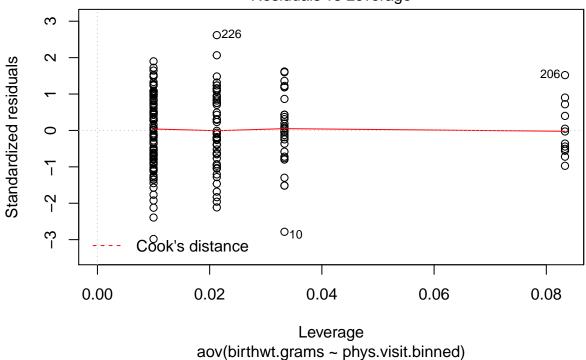

```
plot(aov.birthwt)
```

aov(birthwt.grams ~ phys.visit.binned)

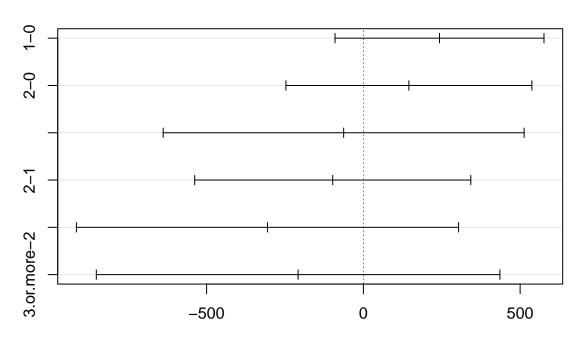

```
posthoc <- TukeyHSD(x=aov.birthwt, 'phys.visit.binned', conf.level=0.95)</pre>
